Instructions for Submission

Please include your name and student ID at the top of your homework submission. You may submit handwritten solutions or typed ones (LaTeX preferred). If you at any point write code to help you solve a problem, please include your code at the end of the homework assignment, and mark which code goes with which problem. Homework is due by start of lecture on the due date; it may be submitted in-person at lecture or by emailing a PDF to both facilitators.

1 Examples of Convex Functions

1. Give an example of a convex function.
2. Give an example of a non-convex function.
3. Give an example of a function which is strictly convex.
4. Give an example of a function which is convex, but not strictly convex.
5. Give an example of a function which is strictly convex, but not strongly convex.
6. Give an example of a function which is 2-strongly convex.
7. Give an example of a function which is convex but has no minima.

2 Feasible Sets

For the following problems, we will consider how the feasible set of solutions $\mathcal{X}$ changes the feasibility of optimization. We will be attempting to optimize the strictly convex function $f(x) = x^2$.

1. Is there a unique global minimum of f if $\mathcal{X} = \mathbb{R}$? If so, what is it? Is this set convex?
2. What if $\mathcal{X} = \{1\}$? Is this set convex?
3. What if $\mathcal{X} = \mathbb{R}\backslash\{0\}$? Is this set convex?
4. Let $\mathcal{X} = (-\infty, -1] \cup [0, \infty)$. Is this set convex? What are the local minima of f in this set? Are all local minima also global minima?
5. Let $\mathcal{X} = (-\infty, -1] \cup [1, \infty)$. Is this set convex? What are the local minima of f in this set? Are all local minima also global minima?

3 Convexity Proofs

1. Let f and g be convex functions. Show that $h(\mathbf{x}) = \max\{f(\mathbf{x}), g(\mathbf{x})\}$ is convex.
2. Let f be a convex function and g be a strictly convex function. Show that $f + g$ is strictly convex.
3. Let f be a convex function and g be an m-strongly convex function. Show that $f + g$ is m-strongly convex.
4. (Optional) Recall that on a vector space V, we can define an inner product $\langle \cdot, \cdot \rangle$ on V which returns another vector in V. Suppose f is differentiable. Show that f is convex if and only if $f(\mathbf{x}) \geq f(\mathbf{y}) + \langle \nabla f(\mathbf{y}), \mathbf{x} - \mathbf{y} \rangle$ for all $\mathbf{x}, \mathbf{y} \in \mathrm{dom} f$.
